

Project Summary

This project introduces a **voluntary educational sharing platform** designed to support students by enabling the exchange and sharing of educational books and tools. The main goal of the platform is to reduce the financial burden on students while promoting collaboration, sustainability, and equal access to educational resources.

The system provides an easy-to-use environment where users can browse, search, and obtain needed materials efficiently. By encouraging reuse of educational resources, the platform helps extend their lifecycle and reduces environmental waste.

Artificial Intelligence is integrated to enhance the user experience through **intelligent search and recommendation mechanisms** that suggest suitable books and tools based on user preferences and usage history. The platform is scalable, accessible from anywhere, and suitable for adoption across different universities and student communities.

Future Work

In future developments, the project can be expanded by adding more advanced intelligent features, including:

- Implementing an **AI-powered chatbot** to support students by:
 - Summarizing books and educational materials.
 - Providing clear and simplified explanations of academic content.
 - Explaining and summarizing educational videos.
 - Generating **summary maps (mind maps)** to improve understanding and revision.
- Creating a **dedicated community for each university**, enabling students to share resources, collaborate academically, and communicate within a trusted and organized environment.
- Enhancing interaction and collaboration tools to support discussions, group learning, and peer assistance among students.
